

03 Case Library RU

Template E v2.3 / Russian Edition

Template E v2.3

Case Library RU / библиотека кейсов

Назначение Case Library

Case Library нужна, чтобы Template E проверялся не на красивых аналогиях, а на реальных и пограничных ситуациях, где recoverability сохраняется, ломается, реконструируется или меняет mission.

Case format

Case ID

Lesson for Framework

Core Case Set

Case ID	Name	Type	Main lesson	Maturity
CASE-SOFT-001	Legacy Software Collapse	Negative / dependency / executable continuity	source code preservation != executable continuity	C-4
CASE-NII-001	Закрытый НИИ / Orphan Documentation	Negative / custody / institutional collapse	documentation survived, recoverability died	C-3
CASE-BIO-001	Adult Murine Hippocampus Vitrification	Positive / functional recoverability	structural preservation is not enough	C-4
CASE-INFRA-001	Qanats / кяризы	Low-dependency / infrastructure	simplicity amplifies continuity	C-4
CASE-ARCHAEO-001	Antikythera Mechanism	Reconstructive / evidential	object survived; operator chain died	C-4
CASE-CIV-001	Monastic Continuity Network	Institutional / distributed memory	distributed institutions preserve operators	C-3/C-4
CASE-MIL-001	Tank Storage	Operational asset / component recoverability	asset is a recoverability graph	C-2/C-3
CASE-MED-ORTHO-001	Arthroplasty under regenerative pressure	Medical capability / managed sunset	medical capability must outlive peak demand	C-2/C-3
CASE-CULT-001	Chimney Sweep	Transformative /	operational	C-1/C-2

	Brush	craft	knowledge may become cultural knowledge	
CASE-REL-001	Temple to Museum	Transformative / heritage	mission phase transition	C-1/C-2
CASE-MEDIA-001	VHS / Magnetic Tape Archive	Migration / playback infrastructure	media survival != playback recoverability	planned
CASE-AIR-001	Aircraft Donor Storage	Component / donor continuity	donor storage is mission reclassification	planned
CASE-IND-001	Mothballed Industrial Plant	Negative technical / economics / operator loss	physical conservation can fail operationally	planned
CASE-LANG-001	Language Death / Liturgical Survival	Cultural / transformative	daily mission may die while interpretive mission remains	planned
CASE-MUSEUM-001	Conservation vs Function Conflict	Evidence vs operation	evidence preservation may sacrifice function	planned

Приоритеты развития

Priority	Case	Почему
P1	Software Collapse	инженерный, понятный reviewer-ам, сильная проверка DD/ETIG
P1	NII / Orphan Documentation	сильный custody failure, близок к постсоветскому institutional shock
P1	Biobank SOP	проверяет перенос OAIS-подобной логики на биологические объекты
P1	Industrial Mothballing	negative technical case с economics/operator/material failure
P1	Qanat	контрпример high-tech migration logic через low-dependency continuity
P2	Antikythera	reconstructive recoverability
P2	Monastic Network	distributed institutional memory
P2	Military Storage	asset as recoverability graph
P2	VHS Archive	playback chain collapse
P2	Museum Conflict	evidence vs function

CASE-SOFT-001 Summary

Исходники могут сохраниться, но executable continuity умирает из-за dependency collapse, build chain collapse, operator collapse, institutional custody collapse и silent migration damage. Proof test: чистая машина, README, установка зависимостей, сборка, тесты, воспроизведение примера.

CASE-NII-001 Summary

Закрытый НИИ показывает, что документы могут сохраниться физически, но без successor, custody transfer, tacit knowledge capture и proof test становятся orphan technical memory.

CASE-MED-ORTHO-001 Summary

Если регенеративные методы снизят спрос на первичное эндопротезирование, ревизионная хирургия, реестр имплантов, совместимые компоненты и surgical expertise должны сохраняться до исчезновения legacy dependency.

Case anti-bloat rule

Кейс входит в ядро только если он уточняет границу, failure mode, SOP, metric или governance rule. Иначе он идёт в приложение как иллюстрация.

CASE-SPACE-001

CASE-SPACE-001 — Apollo-Era Propulsion Hardware

Field	Value
Domain	Aerospace / operational asset recoverability
Case type	Negative / partial-positive material degradation case
Core lesson	static preservation != dynamic recoverability
Main failure mode	material aging, seal degradation, corrosion, missing test infrastructure
Template E layer	Structural Recoverability + Proof Testing + Material Viability Window
Maturity	C-3/C-4 after source verification

Case summary

Apollo-era propulsion hardware and Saturn V F-1 components demonstrate the difference between physical/evidential preservation and dynamic operational recoverability. Museum artifacts and stored components may preserve structure, documentation and evidential value, but decades of material aging, seal degradation, corrosion, and loss of original test infrastructure can prevent safe full-function return without disassembly, inspection, replacement and partial proof testing.

What failed

- Эластомеры и уплотнения могут терять эластичность и разрушаться при давлении, хотя внешне выглядят сохранными.
- Остатки агрессивных сред или соли/коррозионные агенты могут продолжать локальную деградацию.
- Сварные/паяные соединения и тонкие каналы могут иметь hidden defects, проявляющиеся только при нагрузке.
- Test infrastructure and qualified operators may be partially lost, making full mission proof unsafe or impossible.

Recoverability levels

Level	Status
Physical	high / artifact survives
Evidential	high / historical engineering evidence
Structural	partial / requires inspection
Dynamic functional	uncertain without proof testing and component replacement
Operational / mission	not claimed without modern safety review and dynamic test

Lesson for Template E

A static object can pass visual inspection and still fail at activation. For any dormant dynamic system with seals, elastomers, lubricants, propellant residues, pressure circuits, thermal loads or moving joints, dynamic proof testing must be separated from static preservation claims.

Safe wording

Use: "Apollo-era propulsion hardware demonstrates static preservation vs dynamic recoverability."
Avoid: "Apollo-11 lunar module engine was restarted and failed" unless a specific primary source is provided.

CASE-SPACE-001 — Apollo-Era Propulsion Hardware

Domain

Aerospace / operational asset recoverability / material aging.

Type

Negative / partial-positive material degradation case. C-3 / C-4 candidate.

Safe claim

CASE-SPACE-001 does **not** claim a verified failed restart of an Apollo-11 lunar module engine. The correct claim is narrower:

Apollo-era propulsion hardware and rocket-engine sealing-aging literature demonstrate the general risk that static preservation does not prove dynamic recoverability.

Evidence status

Evidence	Status
NASA F-1 gas generator hot-fire, 2013	official NASA source
F-1 Rocket Engine Technical Manual, 1967	historical technical baseline
silicone rubber sealing-ring ageing literature	peer-reviewed / technical source
specific Apollo-11 LM engine failure	not claimed

Recoverability analysis

Level	Status
Physical	high for preserved/museum hardware
Evidential	high
Static Integrity	may be present
Dynamic Recoverability	requires proof test
Mission Recoverability	not claimable without mission load proof

Lesson

Static Integrity != Dynamic Recoverability

A dormant system can look intact and still fail when returned to pressure, heat, vibration, chemical exposure, movement or mission load.

Failure mode

Activation Failure

Failure appears at activation, not during storage.

Case Maturity Rules v2.3

Level	Requirement
C-0	idea only
C-1	short description
C-2	Template E analysis
C-3	credible secondary sources
C-4	primary / technical / institutional sources
C-5	domain reviewer checked

C-4 must not be assigned without primary source, technical report, institutional record, peer-reviewed source or official evidence for the key claim.
